

STANDARDS AND INFORMATION DOCUMENTS

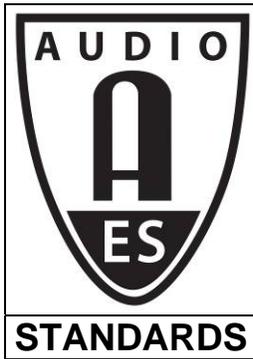

AES-2id-2006

AES Information Document for Digital audio engineering - Guidelines for the use of the AES3 interface

Users of this standard are encouraged to determine if they are using the latest printing incorporating all current amendments and editorial corrections. Information on the latest status, edition, and printing of a standard can be found at:
<http://www.aes.org/standards>

AUDIO ENGINEERING SOCIETY, INC.
60 East 42nd Street, New York, New York 10165, US.

The AES Standards Committee is the organization responsible for the standards program of the Audio Engineering Society. It publishes a number of technical standards, information documents and technical reports. Working groups and task groups with a fully international membership are engaged in writing standards covering fields that include topics of specific relevance to professional audio. Membership of any AES standards working group is open to all individuals who are materially and directly affected by the documents that may be issued under the scope of that working group.

Complete information, including scopes of working groups and project status is available at <http://www.aes.org/standards>. Enquiries may be addressed to standards@aes.org

The AES Standards Committee is supported in part by those listed below who, as Standards Sustainers, make significant financial contribution to its operation.

This list is current as of 2017/5/11

AES information document for digital audio engineering — Guidelines for the use of the AES3 interface

Published by

Audio Engineering Society, Inc.

Copyright © 2006 by the Audio Engineering Society

Abstract

This document provides guidelines for the use of AES3, *AES recommended practice for digital audio engineering — Serial transmission format for two-channel linearly represented digital audio data*, together with AES5, *AES recommended practice for professional digital audio applications employing pulse-code modulation — Preferred sampling frequencies*, and AES11, *AES recommended practice for digital audio Engineering — Synchronization of digital audio equipment in studio operations*.

An AES standard implies a consensus of those directly and materially affected by its scope and provisions and is intended as a guide to aid the manufacturer, the consumer, and the general public. An AES information document is a form of standard containing a summary of scientific and technical information; originated by a technically competent writing group; important to the preparation and justification of an AES standard or to the understanding and application of such information to a specific technical subject. An AES information document implies the same consensus as an AES standard. However, dissenting comments may be published with the document. The existence of an AES standard or AES information document does not in any respect preclude anyone, whether or not he or she has approved the document, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. This document is subject to periodic review and users are cautioned to obtain the latest edition.

Table of contents

Abstract	1
Foreword to 1996 edition.....	4
Foreword to 2006 edition.....	4
1 Scope	5
2 References	6
3 Glossary and Definitions	8
3.1 Glossary of abbreviations	8
3.2 Definitions	8

E.1 Application	66
E.2 Introduction	66
E.3 The technique	66

Foreword to 1996 edition

In 1990, the SC-02 Subcommittee on Digital Audio of the Audio Engineering Society Standards Committee (AESSC) set up a working sub-group, SC-02-02-01, under the chairmanship of S. Lyman, to prepare a guideline document, AES-2id, for use with the AES3 digital interface. To expedite discussion of these guidelines, the AESSC made public draft clauses of the document by means of publication in the AESSC News column of the *Journal of the Audio Engineering Society*. Unlike this document, those clauses had been for discussion only, having only the status of committee drafts, subject to extensive change. They did not have the status of consensus approval and are not AES standards or information documents. Those clauses have been revised and are included in this document together with additional clauses.

The information in 7.4 was drawn mainly from the paper (preprint 3705) Towards Common Specifications for Digital Audio Interface Jitter, by J. Dunn, B. A. McKibben, R. Taylor, and C. Travis, presented at the 95th Convention of the Audio Engineering Society, 1993-10

Robert A. Finger,
Chair, SC-02-02 Working Group on Digital Input/Output Interfacing
1995-10

Foreword to 2006 edition

[This foreword is not a part of *AES information document for digital audio engineering – Guidelines for the use of the AES3 interface*, AES-2id-2006.]

This document was written by C. R. Caine with contributions from J. Brown, R. Bristow-Johnson, H. Nakashima, and others. The work of the late Julian Dunn on jitter in section 7.4 is particularly acknowledged and is reproduced verbatim. The document integrates all that information relating to standards AES3, AES5, AES11 and information document AES-3id that is important to implementation of AES3 but which is itself not part of the standard in any normative sense.

Many changes have occurred to AES3 since this document was partially revised in 1996. The next revision of AES3 may involve a complete restructuring to split physical, transport and essence into separate parts which may be more conveniently revised thereafter. This text has therefore been set out so that references to the current AES3 can easily be revised when AES3 is revised. It is expected that AES-3id will be incorporated in AES3 at that time.

J. Grant,
Chair, SC-02-02 Working Group on Digital audio input/output interfacing.

Corrigendum 2007-06-15

in clause 5.2.2.13, “100/1001” corrected to “1000/1001”.

Addenda 2010-02-19

A new multi-part revision of AES3 was published in 2009. Its technical content is intended to be identical to the relevant parts of the 2003 edition as amended by Amendment 5 (2008) and Amendment 6 (2008). Where this document refers to clauses of earlier editions of AES3, equivalent references to AES3-2009 are also offered as editorial addenda [*identified by italic text in square brackets*].

AES information document for digital audio engineering - Guidelines for the use of the AES3 interface

1 Scope

The information presented in this guideline is not a part of the AES3 standard. It is intended to assist a user to understand and use the digital audio interface. The examples provided are not intended to be restrictive, but to clarify. The AES3C hopes these guidelines will further the design of mutually compatible interfaces and encourage consistent operational practices. This revision includes details on the implementation of the coaxial interface described in AES-3id-2001 *AES information document for Digital audio engineering -- Transmission of AES3 formatted data by unbalanced coaxial cable*.

The document covers several topics, some relating to interpretation of AES3-2003 and some providing general guidance derived from experience with the interface.

The clauses relating to interpretation of the standard are divided into 'Essence', that is the audio content which is the *raison d'être* of the interface; 'Metadata', or the data relating to that audio content; 'Transport', being the organisation of these into a bitstream; and 'Physical', the mechanical and electrical properties which are the reality of making a connection which will work and where in practice most difficulties have occurred.

Other clauses deal with typical problems, and issues of passing AES3 through other transports.
