The AES Standards Committee is the organization responsible for the standards program of the Audio Engineering Society. It publishes technical standards, information documents and technical reports. Working groups and task groups with a fully international membership are engaged in writing standards covering fields that include topics of specific relevance to professional audio. Membership of any AES standards working group is open to all individuals who are materially and directly affected by the documents that may be issued under the scope of that working group.

Complete information, including working group scopes and project status is available at [http://www.aes.org/standards](http://www.aes.org/standards). Enquiries may be addressed to standards@aes.org

The AES Standards Committee is supported in part by those listed below who, as Standards Sustainers, make significant financial contribution to its operation.

AES Recommended practice for sound-reinforcement systems — Communications interface (PA-422)

Published by
Audio Engineering Society, Inc.
Copyright ©1991 by the Audio Engineering Society

Abstract
This Audio Engineering Society (AES) Standard specifies the electrical characteristics of a balanced-voltage circuit for the interchange of serial binary signals for the control of sound-reinforcement systems. It provides for interchange among data terminal equipment (DTE), that is, computers and microprocessors, and data circuit-terminating equipment (DCE). PA-422 is a mnemonic, signifying professional audio implementation of Electronics Industries Association EIA-422-A. Device control language is provided in an annex.

An AES standard implies a consensus of those directly and materially affected by its scope and provisions and is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an AES standard does not in any respect preclude anyone, whether or not he or she has approved the document, from manufacturing, marketing, purchasing, or using products, processes, or procedures not in agreement with the standard. Prior to approval, all parties were provided opportunities to comment or object to any provision. Approval does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the standards document. This document is subject to periodic review and users are cautioned to obtain the latest edition.

Foreword

This standard has been prepared by the Working Group on Sound System Control, a working group of the Audio Engineering Society Standards Committee. It is designed in the public interest to eliminate misunderstandings between manufacturers, consultants, purchasers, and users, and to facilitate interchangeability, integration, and improvement of products, thus allowing the selection and utilization of the proper product for a particular need.

The standard may involve patents on articles, materials, or processes. The AES assumes no liability to any patent owner, nor does it assume any obligation whatever to parties adopting the standard.

The following individuals have contributed to the preparation of this document: Steve Bartlett, Mitchell Bentz, Mahlon Burkhard, Larry Driskill, William Edwards, Ali Elwakhi, Dan Garrigan, Gary Hardesty, John Johnson, Hardy Martin, Richard Mitchell, Bill Murphy, Charles Richmond, Gene Rimkeit, Robert Rodgers, Tom Roseberry, Kelly Vickery, Saul Walker, and Edward Young.

TOM ROSEBERRY, Chairman
AES Standards Committee Working Group on Sound System Control
1990 May

At the time of approval of this document for publication, the AES Standards Committee had the following membership: Yoshi-Haru Abe, James S. Brawley, Richard C. Cabot, Peter D'Antonio, Donald Eger (Chair), Robert A. Finger, Irving Joel, William Hogan, Tomlinson F. Holman, Mike Klasco, David L. Klepper, Bart N. Locanthi, J.P. Nunn, Daniel Queen (Secretary), Tom Roseberry, W.T. Shelton, William D. Storm, Ted Telesky, Han Tendeloo, and Floyd E. Toole.

The American National Standards Institute version of this standard has not been reprinted and remains available as ANSI S4.49-1991.
1 Scope
This standard specifies the electrical characteristics of the balanced-voltage circuit that may be used when specified for the interchange of serial binary signals among data terminal equipment (DTE), that is, computers and microprocessors, and data circuit-terminating equipment (DCE) of, or in, any point-to-point interconnection of serial binary signals among digitally controlled equipment. The standard contains a device control language (DCL) for controlling communication among the various products. Annex A covers this device control language. The interface includes a driver and an interconnecting cable to a receiver. The electrical characteristics of the circuitry are similar to and expected to perform in the same manner as those of the Electronics Industries Association standard EIA-422-A, hence the mnemonic, PA-422 for professional audio use.

Minimum performance requirements for the interconnecting cable are furnished. Guidance is given with respect to limitations on the data rate imposed by the parameters of cable length, balance, and termination for individual installations.

2 Applicability
The provisions of this standard may be applied to the interfaces used among equipment where the information being conveyed is in the form of serial binary signals at the dc baseband level. This standard shall be referenced by the specifications and specific interface standards applying these electrical characteristics. Typical points of applicability for this standard are depicted in figure 1.

**Figure 1 – Applications of communications interface**

The balanced-voltage digital interface should be utilized on data, timing, or control circuits in appropriate applications. This is to ensure the elimination of any outside electrical interference which might disrupt the operation. The data rate of the signals can range up to over $10^6$ bits per second. The maximum rate for an individual application is dependent on the cable type and length. While a restriction on maximum cable length is not established, guidelines are given with respect to conservative operating distances as a function of the data signaling rate (see Section 5).

In general, these conservative values may be exceeded where the installation is engineered to ensure that noise and ground potential values are held to a minimum.
