The AES Standards Committee is the organization responsible for the standards program of the Audio Engineering Society. It publishes technical standards, information documents and technical reports. Working groups and task groups with a fully international membership are engaged in writing standards covering fields that include topics of specific relevance to professional audio. Membership of any AES standards working group is open to all individuals who are materially and directly affected by the documents that may be issued under the scope of that working group.

Complete information, including working group scopes and project status is available at <http://www.aes.org/standards>. Enquiries may be addressed to standards@aes.org

The AES Standards Committee is supported in part by those listed below who, as Standards Sustainers, make significant financial contribution to its operation.

AES recommended practice for digital audio engineering - Synchronization of digital audio equipment in studio operations

Published by

Audio Engineering Society, Inc.

Copyright ©2009 by the Audio Engineering Society

Abstract

This standard provides a systematic approach to the synchronization of digital audio signals. Recommendations are made concerning the accuracy of sample clocks as embodied in the interface signal and the use of this format as a convenient synchronization reference where signals must be rendered cotimed for digital processing. Synchronism is defined, and limits are given which take account of relevant timing uncertainties encountered in an audio studio.

An AES standard implies a consensus of those directly and materially affected by its scope and provisions and is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an AES standard does not in any respect preclude anyone, whether or not he or she has approved the document, from manufacturing, marketing, purchasing, or using products, processes, or procedures not in agreement with the standard. Prior to approval, all parties were provided opportunities to comment or object to any provision. Attention is drawn to the possibility that some of the elements of this AES standard or information document may be the subject of patent rights. AES shall not be held responsible for identifying any or all such patents. Approval does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the standards document. This document is subject to periodic review and users are cautioned to obtain the latest edition. Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Foreword

[This foreword is not a part of AES11-2009, *Recommended practice for digital audio engineering - Synchronization of digital audio equipment in studio operations.*]

Foreword to second revision (1997)

This document is a revision of AES11-1991. It provides operating standards and guidance for users needing to synchronize digital audio signals. This is an essential requirement in studios for the handling of remote program sources. The development of a working practice for this aspect of system engineering follows from the standardization of sampling frequencies and the international agreement on the serial transmission format for the professional environment.

A working group was established in 1984 by the Subcommittee on Digital Audio of the AES Standards Committee to consider the topic with the possibility of formulating a policy on behalf of the industry. An approach was made to some 60 manufacturers of equipment to seek their advice and comment. Meetings were attended by engineers able to represent views from the Society of Motion Picture and Television Engineers (SMPTE), the European Broadcast Union (EBU), and the International Electrotechnical Commission (IEC). The final conclusions endorse the AES3 and AES5 standards and seek to address, primarily, the principles to be applied in synchronizing operations, thus allowing for future developments affecting digital audio systems.

Following adoption in 1991, considerable interest developed in the use of AES3 signals for audio associated with digital video applications. In 1993, the AES published a proposal in the Journal of the Audio Engineering Society, vol. 41, no. 5. In 1994-10, a joint meeting was held between the working group and the corresponding SMPTE group. Other meetings were held with representatives of SMPTE, IEC, and EBU. This revision is the result of the proposal and the subsequent meetings.

The following individuals have contributed directly to the writing of this revision: R. Cabot, R. Caine, J. Dunn, L. Fielder, R. Finger, N. Gilchrist, A. Griffiths, P. Lidbetter, J. Nunn, and G. Roe.

Paul Lidbetter

Chair, AESSC SC-02-05 Working Group on Synchronization of the SC-02 Subcommittee on Digital Audio
1996-08

Foreword to third revision (2003)

This document revises AES11-1997. The revision was undertaken as project AES11-R by the AES Standards Committee, Working Group SC-02-05 on Synchronisation. Development in working practices in digital audio and networking have given rise to more complex hierarchical systems of synchronisation, and the growth of metadata also makes more demands on reference signals. These developments are ongoing, but provision is made to expedite implementation of these when required. An annex is added by popular request to describe Word Clock, even though it has been found not to be possible to standardise it. This work has been carried out by a Task Group led by R. Caine, chair of SC-02-05. Contributors included: S. Dimond, R. Foss, J. Grant, R. Harris, B. Klinkradt, S. Lyman, A. Mason, J. Nunn, M. Poimboeuf, S. Scott, Y. Sohma, M. Yonge.

Robin Caine

Chair, AESSC SC-02-05 Working Group on Synchronization of the SC-02 Subcommittee on Digital Audio
2003-06

Foreword to fourth revision (2009)

This document revises AES11-2003, including corrigenda and addenda. The revision was undertaken as project AES11-R by Working Group SC-02-02 on Digital Input/Output Interfacing.

The relationship with AES5 has been clarified, with tolerances specified only in AES11 and nomenclature for multiple rates only in AES5. The subclause on video referencing (4.5) and Annex B (Word Clock) have been revised to more accurately reflect the current situation in the field. Annex C has been added.

Contributors included R. Caine, D. Errock, K. Hamasaki, S. Heinzmann, and J. Woodgate.

John Grant

Chair, AESSC SC-02-02 Working Group on Digital Input/Output Interfacing of the SC-02 Subcommittee on Digital Audio, 2009-02

Addendum 2010-02-19

A new multi-part revision of AES3 was published in 2009. Its technical content is intended to be identical to the relevant parts of the 2003 edition as amended by Amendment 5 (2008) and Amendment 6 (2008). Where this document refers to clauses of earlier editions of AES3, equivalent references to AES3-2009 are also offered, [*identified by italic text in square brackets*].

Note on normative language

In AES standards documents, sentences containing the word “shall” are requirements for compliance with the document. Sentences containing the verb “should” are strong suggestions (recommendations). Sentences giving permission use the verb “may”. Sentences expressing a possibility use the verb “can”.

AES recommended practice for digital audio engineering - Synchronization of digital audio equipment in studio operations

1 Scope

1.1 General

This document provides a recommended practice for manufacturers and users of digital audio equipment aimed at promoting economical and efficient methods for synchronizing interconnected digital audio equipment.

Synchronization of digital audio signals is a necessary function for the exchange of signals between equipment. The objective of synchronization is primarily to time align sample clocks within digital audio signal sources. The provisions address only essential aspects necessary for successful studio operation.

The provisions make use of the two-channel digital audio interface standard for professional use, AES3. It is expected that the recommendations will be adopted for synchronizing all other digital audio interfaces.

The document addresses two groups of parameters. The first concerns the performance requirements for the successful interchange of digital audio data between equipment (5). The second concerns the performance requirements for the regeneration of clocks used for analog-to-digital and digital-to-analog, conversion (6).

1.2 Area of application

Items of stand-alone digital audio equipment interconnected via analog inputs and outputs require no consideration in this document.

The primary area of application is the digital interconnection of digital audio equipment wholly contained within the studio environment. There is a further application in which signal sources and destinations external to the studio environment interface with the equipment within the studio environment.

1.2.1 Digital interconnections within the studio environment

Digital audio equipment within a self-contained area, such as a studio or studio center, exchanges digital signals with the timing from all items of equipment controlled.

1.2.2 Digital interconnections involving sources and destinations outside the studio environment

Digital interconnections involve equipment, either local or remote, with timing not under the control of the studio or studio center.

1.2.3 Digital audio associated with video

Digital audio equipment within a self-contained area exchanges audio signals between audio and video equipment, or both, in which the timing is derived from a master video reference.
